Inspiration

Atlas of Hillforts of Britain and Ireland

From Wikipedia, the free encyclopedia

The **Atlas of Hillforts of Britain and Ireland** is an online database of [hillforts](#)—fortified settlements built in the [Bronze Age](#) and [Iron Age](#)—in the British Isles. It was compiled by researchers from the [University of Edinburgh](#), the [University of Oxford](#) and [University College Cork](#), led by [Ian Ralston](#) and [Gary Lock](#).^{[1][2]} As of 2017, the atlas has 4,147 entries, which the researchers believe to be all of the extant hillforts in Britain and Ireland.^{[1][3]} A printed [atlas](#) is also planned.^[4]

The data was collated from existing catalogues of archaeological sites such as the [National Monuments Records](#) and county [historic environment records](#).^[4] Around 100 volunteers, described as "citizen scientists", also visited sites and contributed information and photographs to the atlas.^{[5][6]} The researchers noted that despite the conventional name "hillforts", under their definition, many are "not on hills and are not really forts".^[7] They included sites that are now only visible through [cropmarks](#).^[4]

The online atlas is hosted by the [Arts and Humanities Research Council](#), which funded the project,^[8] and makes use of [Esri's ArcGIS web map application](#) platform.^[9] The project also collaborated with [Wikimedia UK](#) to make the information in the atlas available to [Wikipedia](#).^[1]

[View on WikiData](#)

Summary: This coastal promontory is located immediately SE of Bunmahon town in Co. Waterford. Known as C'Gullys Islands, this triangular grass-covered headland projects SW from the mainland into the Atlantic at an altitude of 5m OD. The landmass is cut off on the landward side by an eroded earthen bank which runs in an E-W direction for c. 35m. It is 6m in width and has an external height of 1.2m. An external ditch measures 8m in width and has a depth of 0.35m. An Ogham stone was recovered from the ditch in the 1980s while another was found in the 1990s (Manning 1989). There is no recorded entrance through the defences. In addition to the area on the mainland, it is likely that the interior once incorporated two off-shore sea stacks that have been separated by the erosion of collapsed sea arches; if so the interior of the fort may have measured in the order of 90m in length and may have extended to 0.18ha. There are no recorded internal features.

Über Vici.org

Vici.org is the archaeological atlas of classical antiquity. It is a community driven archaeological map, inspired by and modelled after Wikipedia.

The first version of Vici.org went online in May 2012. It was preceded by a sister website [Omnesviae.org](#), a roman routeplanner based on the Peutinger map. Since its start, Vici.org has grown a lot. At the time to this writing, over 140 contributors have added nearly 20,000 locations, approximately 1,000 line tracings and over 3,000 images.

Open Data

Similar to Wikipedia, all written content is available for reuse using the [Creative Commons Attribution-ShareAlike](#)-license. Metadata is available using the [CC0 / Public Domain](#) dedication. Images or line tracings may be available under other licenses. Vici.org invites everyone to participate and share his or her knowledge of classical antiquity. Vici.org does provide various services to reuse this shared knowledge, through various [dataservices](#) or by using the [Vici widget](#).

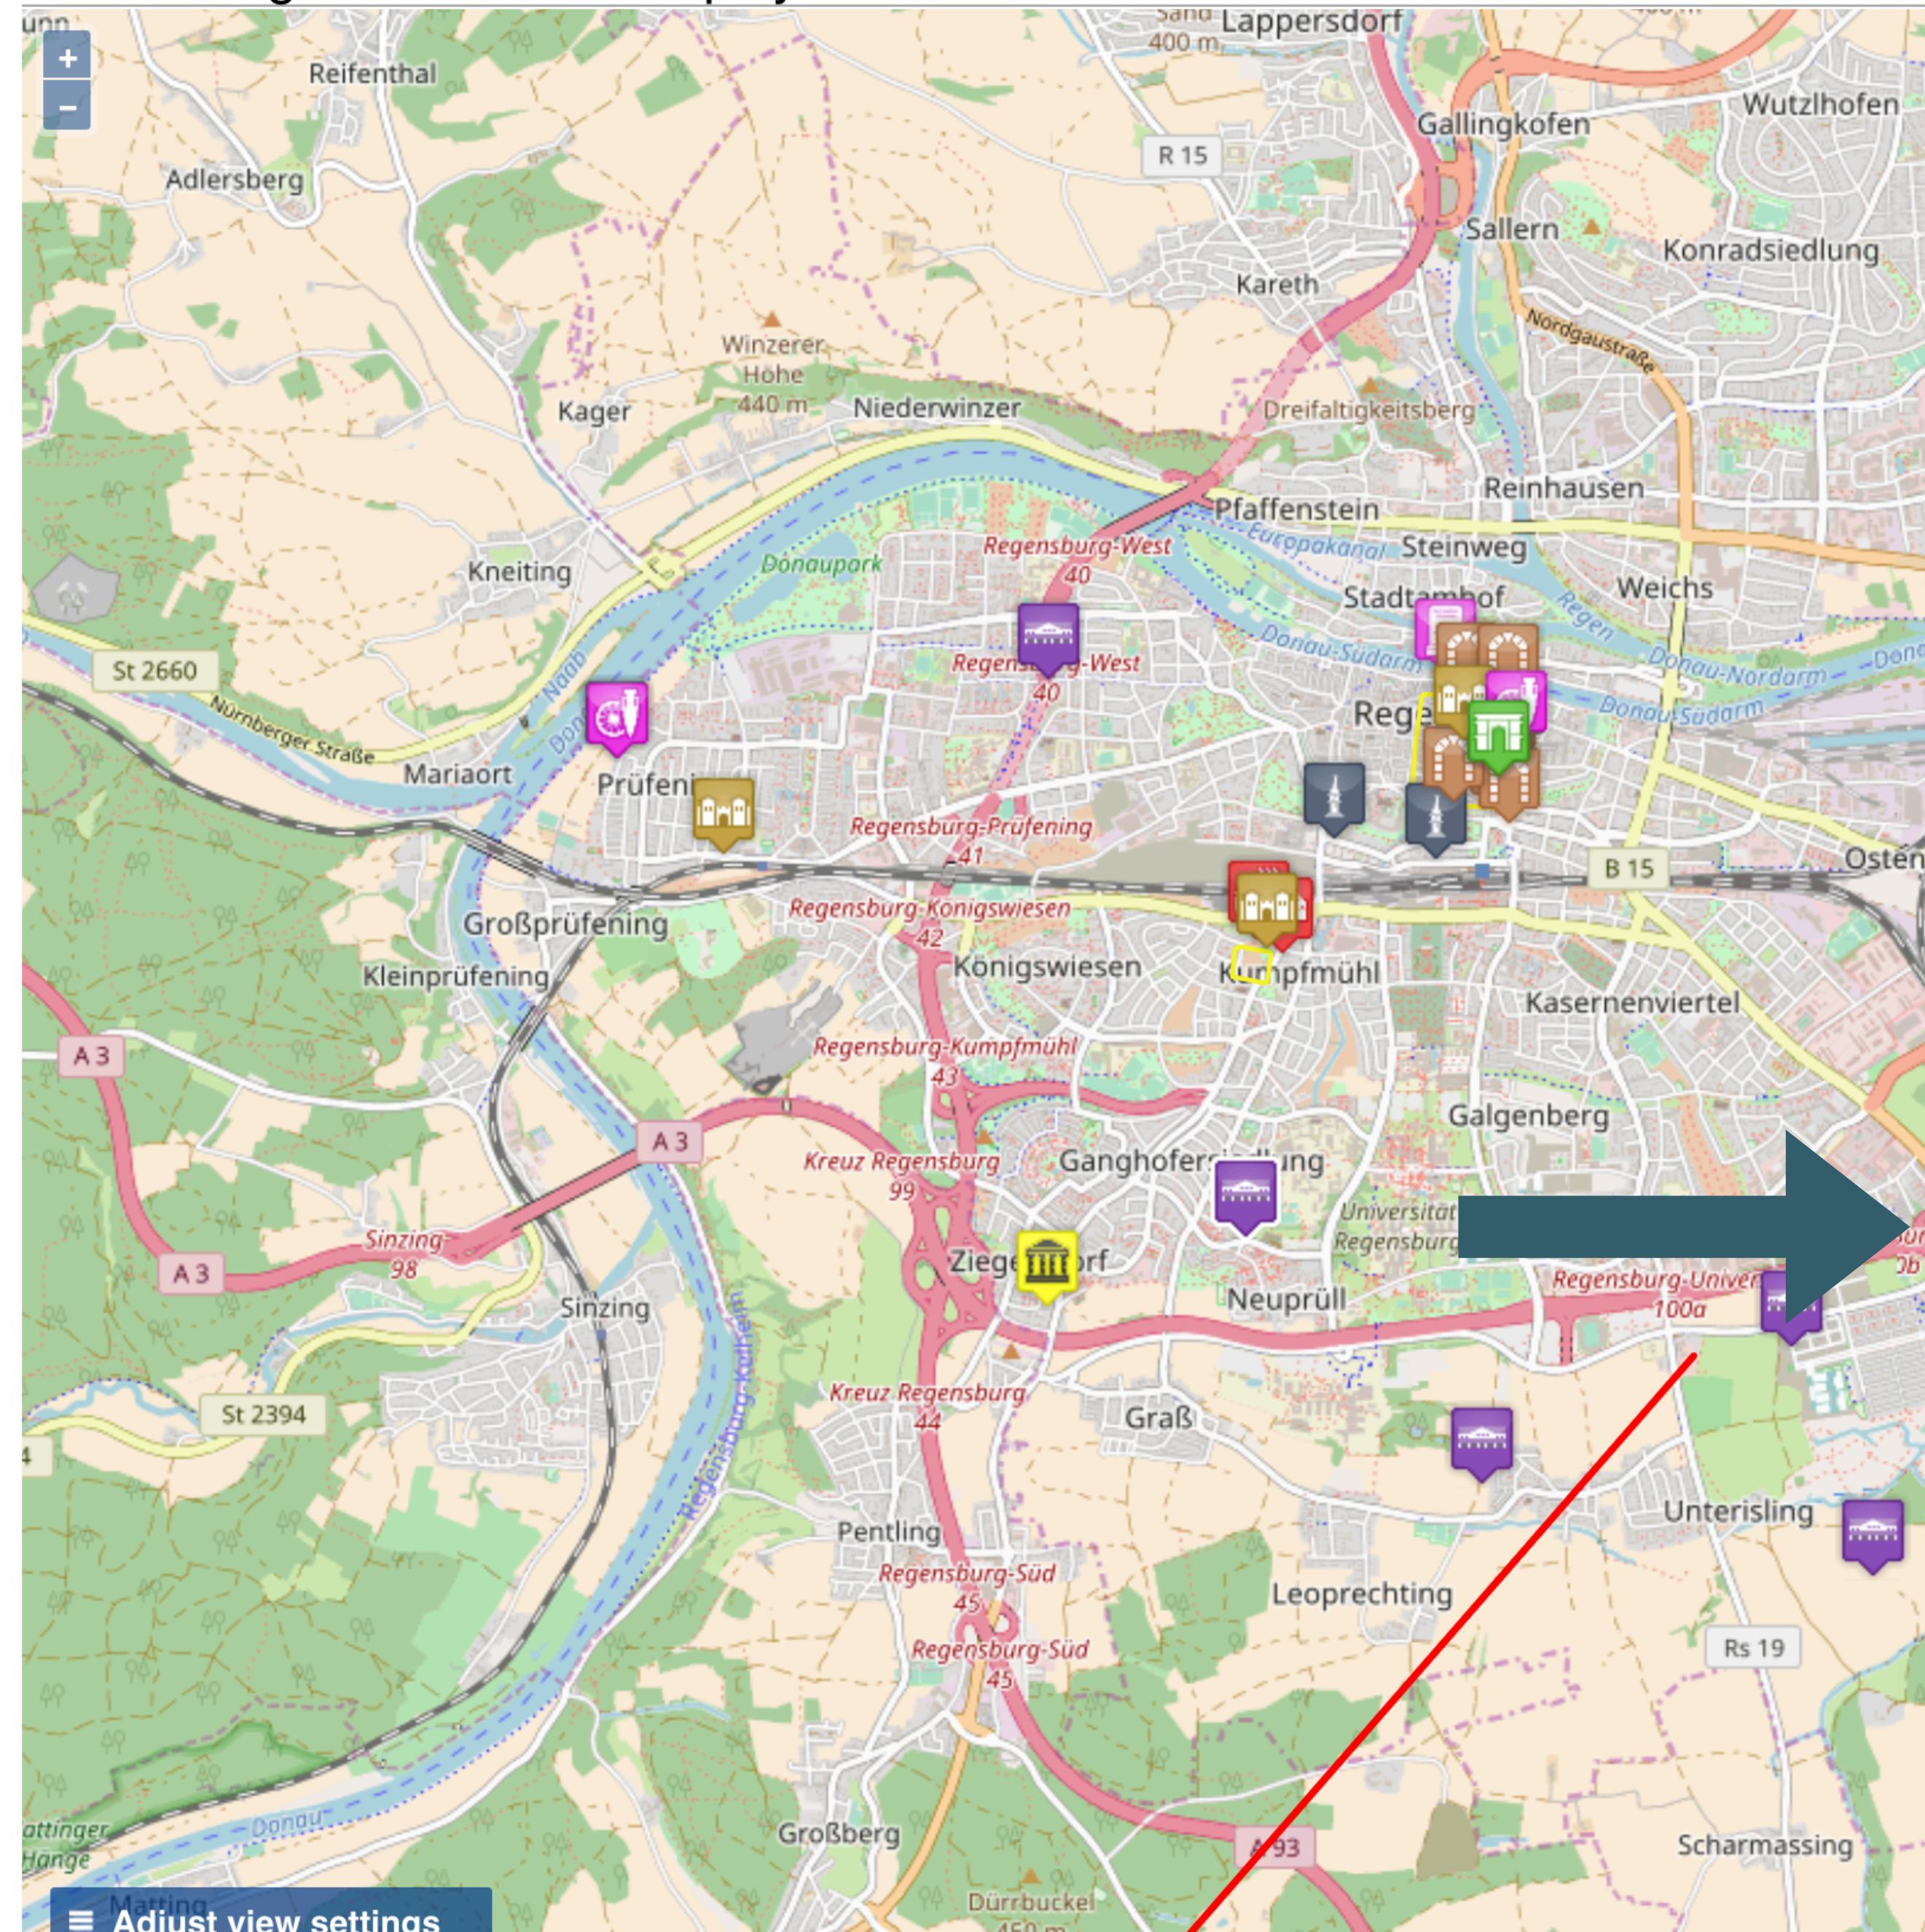

René Voorburg, December 2014.

Application Concept

Develop an application supporting an exploration of
Archaeological Sites of Interest

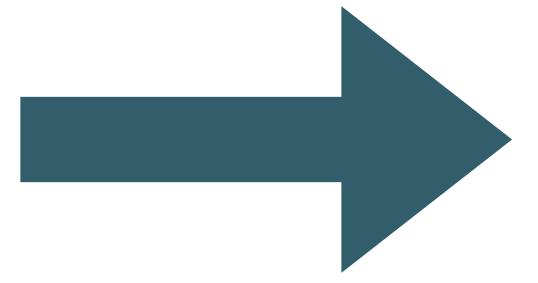

Users are archaeology students.

App should contain a list of sites they have been
assigned to visit.

Users visit site, take photos + notes which augment the
information on the site provided by the app.

Students can add additional sites - which may be
uncharted

Gitflow Workflow

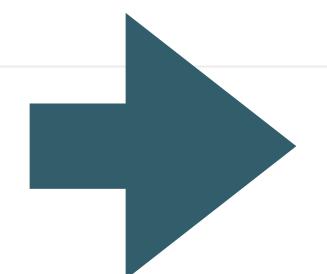

Gitflow Workflow is a Git workflow design that was first published and made popular by [Vincent Driessen at nvie](#). The Gitflow Workflow defines a strict branching model designed around the project release. This provides a robust framework for managing larger projects.

Gitflow is ideally suited for projects that have a scheduled release cycle. This workflow doesn't add any new concepts or commands beyond what's required for the [Feature Branch Workflow](#). Instead, it assigns very specific roles to different branches and defines how and when they should interact. In addition to feature branches, it uses individual branches for preparing, maintaining, and recording releases. Of course, you also get to leverage all the benefits of the Feature Branch Workflow: pull requests, isolated experiments, and more efficient collaboration.
